

THE IMPORTANCE OF SOLAR POWER IN SOUTH AFRICA - by Abonga Tom

If wind and solar power can be build in homes many can benefit and even more jobs can be created ,

Like in china 25 000mw of wind power have station generating far been built , Europe has been planning to build 100 000mw of offshore wind power alone. Why are these countries building these renewable energies they have noticed that in to save their resources they can use renewable energeis.

Every country in Europe is using solar power to limit their electricity problems ,in South Africa solar power is in full demand but yet the government is not responding with solutions that can lead to less electricity power cuts.

Government needs to take notice of what is happening because our country is facing many challenges that can be limited by these renewables energies . Nuclear power is not a solution because it has many waste product gases that can cause some explosions and problems in the future so let us do what is best for this country and this planet.
